DO WELL!!!**

1. Consider the following binary numbers:

$$M = 101101$$

$$N = 11.001$$

Using 3-bit precision compute in binary:

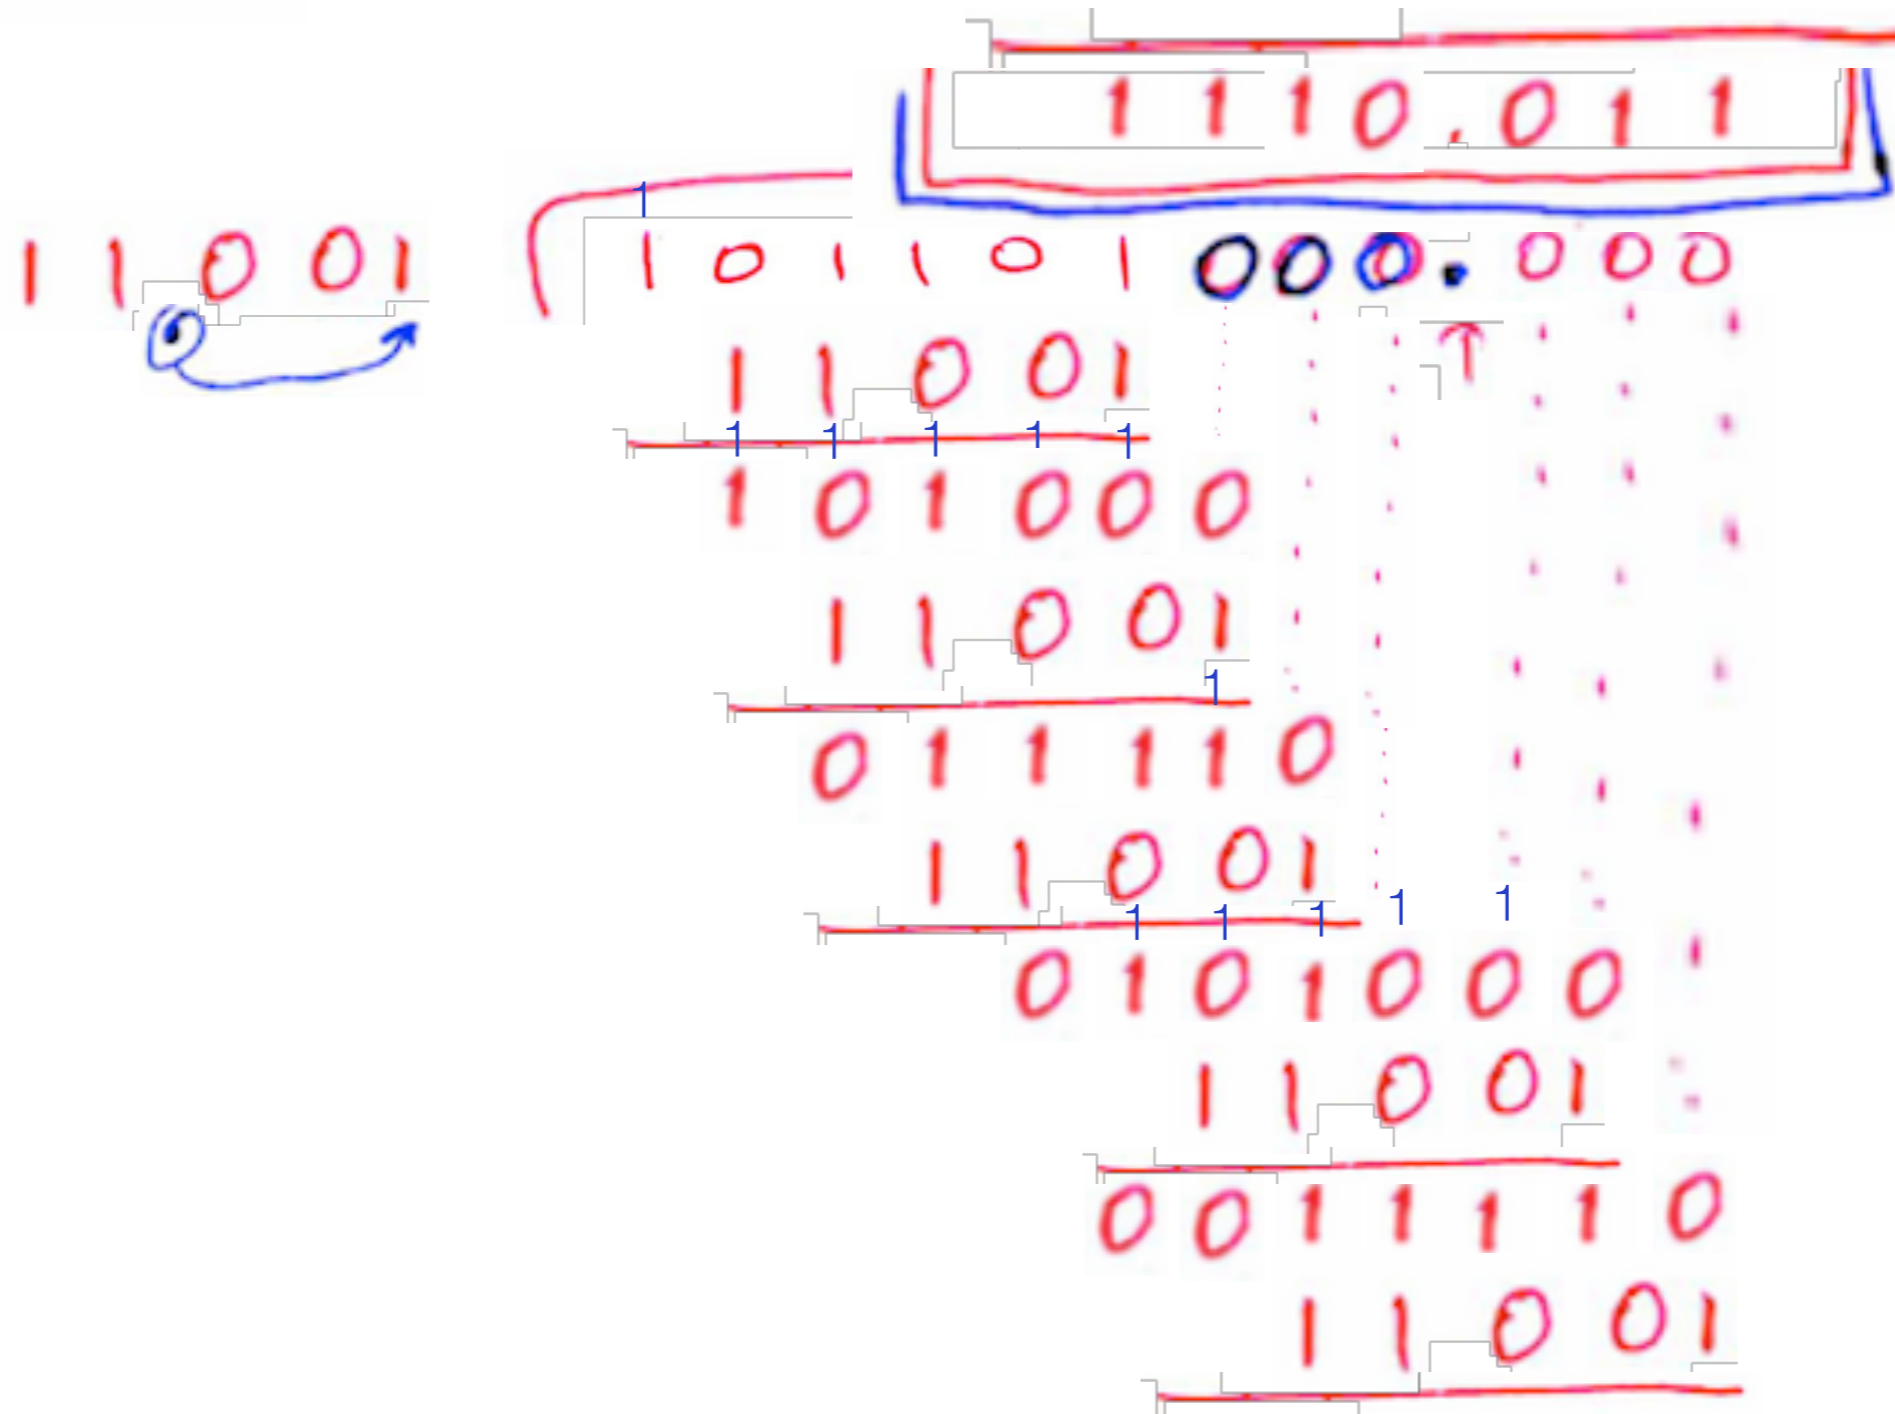

1) MN
Solution

$$\begin{array}{r}
 101101 \times \\
 11.001 \\
 \hline
 101101 \\
 101101 \\
 101101 \\
 \hline
 1000110.101
 \end{array}$$

2) M/N
 Solution

$M = 101101$
 $N = 11.001$

3-bit precision

2. We have the following equality:

$$24_r + 18_r = 40_r$$

where all the numbers are written in the same base r , as indicated.
Determine r , and clearly encircle the result.

Solution

Convert to decimal:

$$2r + 4 + r + 8 = 4r \quad \leftrightarrow \quad \boxed{r = 12}$$

Proof

Prove: $24_{12} + 18_{12} = 40_{12}$, that is:

$2 \times 12 + 4 + 1 \times 12 + 8 = 4 \times 12$, which is equivalent to:

$$28 + 20 = 48 \quad \boxed{\text{True!}}$$

1-12. Perform the following binary multiplications:

(a) 1101×1011 (b) 0101×1010 (c) 100111×011011

(a)

$$\begin{array}{r} 1101 \times \\ 1011 \\ \hline 1101 \\ 1101 \\ 1101 \\ 1101 \\ \hline 10001111 \end{array}$$

Handwritten solution for (a) showing the multiplication of 1101 by 1011. The multiplicand 1101 is written four times, shifted to the left by 0, 1, 2, and 3 positions. A box highlights the four 1s in the multiplier. The final product 10001111 is boxed in blue.

(c)

$$\begin{array}{r} 100111 \times \\ 011011 \\ \hline 100111 \\ 100111 \\ 100111 \\ 100111 \\ 100111 \\ 100111 \\ \hline 10000011101 \end{array}$$

Handwritten solution for (c) showing the multiplication of 100111 by 011011. The multiplier 011011 is written six times, shifted to the left by 0, 1, 2, 3, 4, and 5 positions. A box highlights the six 1s in the multiplier. The final product 10000011101 is boxed in blue.

1-14. A limited number system uses base 12. There are at most four integer digits. The weights of the digits are 12^3 , 12^2 , 12 , and 1 . Special names are given to the weights as follows: $12 = 1$ dozen, $12^2 = 1$ gross, and $12^3 = 1$ great gross.

(a) How many beverage cans are in 6 great gross + 8 gross + 7 dozen + 4?

(b) Find the representation in base 12 for 7569_{10} beverage cans.

$$12^2 = 144 \quad ; \quad 12^3 = 1728$$

(a) $6 \times \overbrace{1728}^{=12^3} + 8 \times \overbrace{144}^{=12^2} + 7 \times 12 + 4 = \dots$

(b) $7569_{10} = 4 \overbrace{1728}^{\text{gr. gross}} + 4 \overbrace{144}^{\text{gross}} + 6 \overbrace{12}^{\text{doz}} + 9 =$

$$\begin{array}{r} 7569_{10} \\ \underline{6912} \\ = 657 \\ \underline{576} \\ = 81 \\ \underline{72} \\ = 9 \end{array}$$

$$= \boxed{4 \ 4 \ 6 \ 9 \text{ base } 12}$$

1-16. *In each of the following cases, determine the radix r :

(a) $(BEE)_r = (2699)_{10}$ (b) $(365)_r = (194)_{10}$

(a)
$$\underbrace{11}_B \cdot r^2 + \underbrace{14}_E \cdot r + \underbrace{14}_E = 2699$$

$$Br^2 + Er = 2699 - 14 = 2685$$

alternative 1 (Note: r is a divisor of 2685: factorize it!)

$$r(Br + E) = 2685 = 179 \times \underbrace{3 \times 5}_{\text{base}}$$

$$15 = r$$

alternative 2 (Use quadratic formula)

$$11r^2 + 14r - 2685 = 0$$

Use formula to solve quadratic equations

to get the result, but the coefficients are large!

$$r_{1,2} = \frac{-14 \pm \sqrt{14^2 + 4 \cdot 11 \cdot 2685}}{2 \cdot 11}$$

(b) solve: $3r^2 + 6r + \underbrace{5 - 194}_{-189} = 0$

Use same formula to solve quadratic

equations to get the result:

Result

$$r = 7$$

(r-1)'s Complement-Representation

r = base Very important: How are our numbers stored?

n, m = number of locations

Definition

r = 2 (N is a binary number!)

How did you compute N_{1c} = 1's complement of N? By swapping 0 \leftrightarrow 1, which is equivalent to:

$$N_{1c} = \underbrace{1 \dots 1}_n . \underbrace{1 \dots 1}_m - N = \underbrace{10 \dots 0}_n . \underbrace{0 \dots 0}_m - \underbrace{0.0 \dots 01}_m - N = 2^n - 2^{-m} - N$$

Base r:

$$N_{(r-1)c} = r^n - r^{-m} - N$$

Algorithm for subtracting two numbers using only addition and the (r-1)'s complement

To perform $M - N$ do:

1) $M + N_{(r-1)c}$

2)

a) If there is an e. a. c. (= end-around-carry = overflow), then add it to the l. s. d. (= least significant digit) of result from 1). Stop.

b) If there is no e. a. c., then the result is negative, and is obtained by taking the (r-1)'s complement of what we obtained at 1); in other words, we compute:

$$- \underbrace{(M + N_{(r-1)c})}_{\text{Result from 1)}}_{(r-1)c}$$

Result from 1)

Stop.

Example in binary + HW assigned

Alg (M-N): 1) $M + N_{(r-1)c}$ 2) a) e.a.c. \rightarrow add it to l.s.d.
 b) no e.a.c. \rightarrow compute $-(r-1)$'s compl. of 1)

Ex-binary $r = 2$ Suppose $n = 4, m = 2$

2-a) Path: i) 2-b) Path: ii) Swap $M \leftrightarrow N$, to get to case 2-b)

Suppose: M: 1101.10

N: 1011.01

Apply algorithm 1) M: $\begin{array}{r} 1 \quad 1 \quad 11 \\ 1101.10 \\ + \\ N_{1c}: 0100.10 \\ \hline \end{array}$

e.a.c. = 1 0010.00 +

\rightarrow case 2-a) \rightarrow 1

0010.01

M: 1011.01

N: 1101.10

Apply algorithm 1) M: $\begin{array}{r} 1 \quad 1 \\ 1011.01 \\ + \\ N_{1c}: 0010.01 \\ \hline \end{array}$

1101.10 no e.a.c. \rightarrow case 2-b)

\rightarrow -1's compl.: \curvearrowright

- 0010.01

as expected

HW (more to follow):

Why does this algorithm work?

Why does this algorithm work?

Hint

We know: $N = \underbrace{\hspace{2cm}}_{n} \cdot \underbrace{\hspace{2cm}}_{m}$

integer part fraction part

$$N_{(r-1)c} = r^n - r^{-m} - N$$

1) $M + N_{(r-1)c} = M + r^n - r^{-m} - N$

2) Whether we follow a) or b) depends on the presence of an e. a. c.

What is the magnitude of the e.a.c.? It's an 'overflow':

e.a.c. : $10 \dots 0$ $= r^n$

n

On branch a) there is an e. a. c., which means we have:

$$\underbrace{M + r^n - r^{-m} - N}_{\text{from 1)}} \geq \underbrace{r^n}_{\text{e.a.c.}} \iff M - N \geq r^{-m}$$

=smallest positive number in our representation

$\iff M - N > 0$ or $M > N$

It also means, that the case when

$M - N = 0$ will take branch b), which means that 0 will be expressed as -0 by this Alg.

Continue justifying the computations in the branches 2-a) and 2-b) as HW.

- 3-A Do the following conversion problems:
- (a) Convert decimal 34.4375 to binary.
 - (b) Calculate the binary equivalent of $1/3$ out to 8 places. Then convert from binary to decimal. How close is the result to $1/3$?
 - (c) Convert the binary result in (b) into hexadecimal. Then convert the result to decimal. Is the answer the same?

3-B Determine the value of base x if $(211)_x = (152)_8$.

3-C Noting that $3^2 = 9$, formulate a simple procedure for converting base-3 numbers directly to base-9. Use the procedure to convert $(2110201102220112)_3$ to base 9.

3-D The solutions to the quadratic equation

$$x^2 - 11x + 22 = 0$$

are $x = 3$ and $x = 6$.

Determine the base of the numbers in the equation.

3-E Convert the hexadecimal number 68BE to binary, and then convert it from binary to octal and then to base 32.
