Motivation

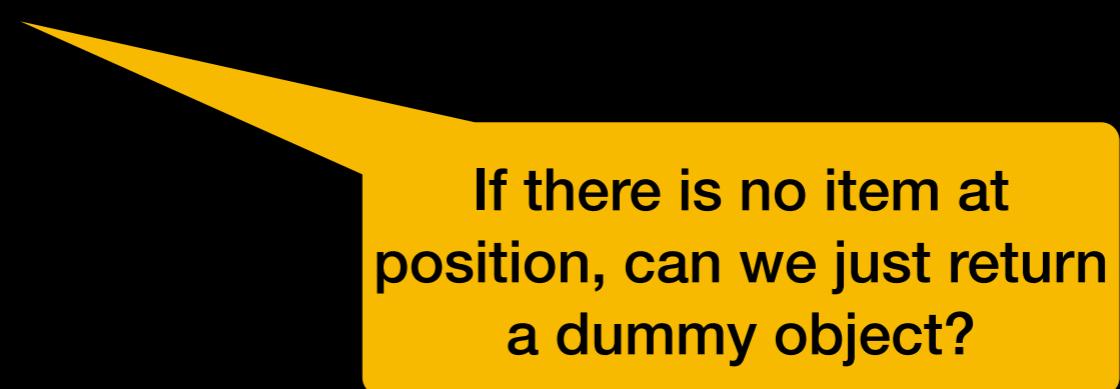

Exceptions (light)

Something should really bother you about the List class...

What?

```
template<typename ItemType>
ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        //MUST RETURN SOMETHING!!!!
}
```

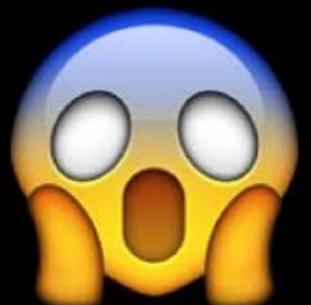

```
template<typename ItemType>
ItemType List<ItemType>::getItem(size_t position) const
{
    ItemType dummy;
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        return dummy;
}
```

If there is no item at position, can we just return a dummy object?

```
template<typename ItemType>
ItemType List<ItemType>::getItem(size_t position) const
{
    ItemType dummy;
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        return dummy; // problem/warning may return
                      // uninitialized object
}
```

The calling function has no way of  
knowing the returned object is  
uninitialized -> UNDEFINED BEHAVIOR

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - **bool** add(**const ItemType&** newEntry);
- Use sentinel value: return error codes

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

???

- Do nothing
- Return false - **bool** add(**const ItemType&** newEntry);
- Use sentinel value: return error codes

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - **bool** add(**const ItemType&** newEntry);
- Use sentinel value: return error codes

Rely on user to handle problem

Rely on user to handle problem

Sometimes it is not possible to return an error code

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - **bool** add(**const ItemType&** newEntry);
- Use sentinel value: return error codes

What happens if there is no item at position when calling  
`getItem(size_t position)`?

# assert

```
#include <cassert>  
// ...  
assert(getPointerTo(position) != nullptr);
```

Make sure this is true

If assertion is false, program execution terminates

# assert

```
#include <cassert>  
// ...  
assert(getPointerTo(position) != nullptr);
```

Make sure this is true

If assertion is false, program execution terminates

Good for testing and debugging

So drastic! Give me  
another chance!

# Exceptions: A Light Introduction

# Exceptions

Software: calling function

Client might be able to recover from a violation or unexpected condition

Communicate **Exception** (error) to client:

- Bypass normal execution
- Return control to client
- Communicate error

# Exceptions

Client might be able to recover from a violation or unexpected condition

Communicate **Exception** (error) to client:

- Bypass normal execution
- Return control to client
- Communicate error

Throw and Exception

# Throwing Exceptions

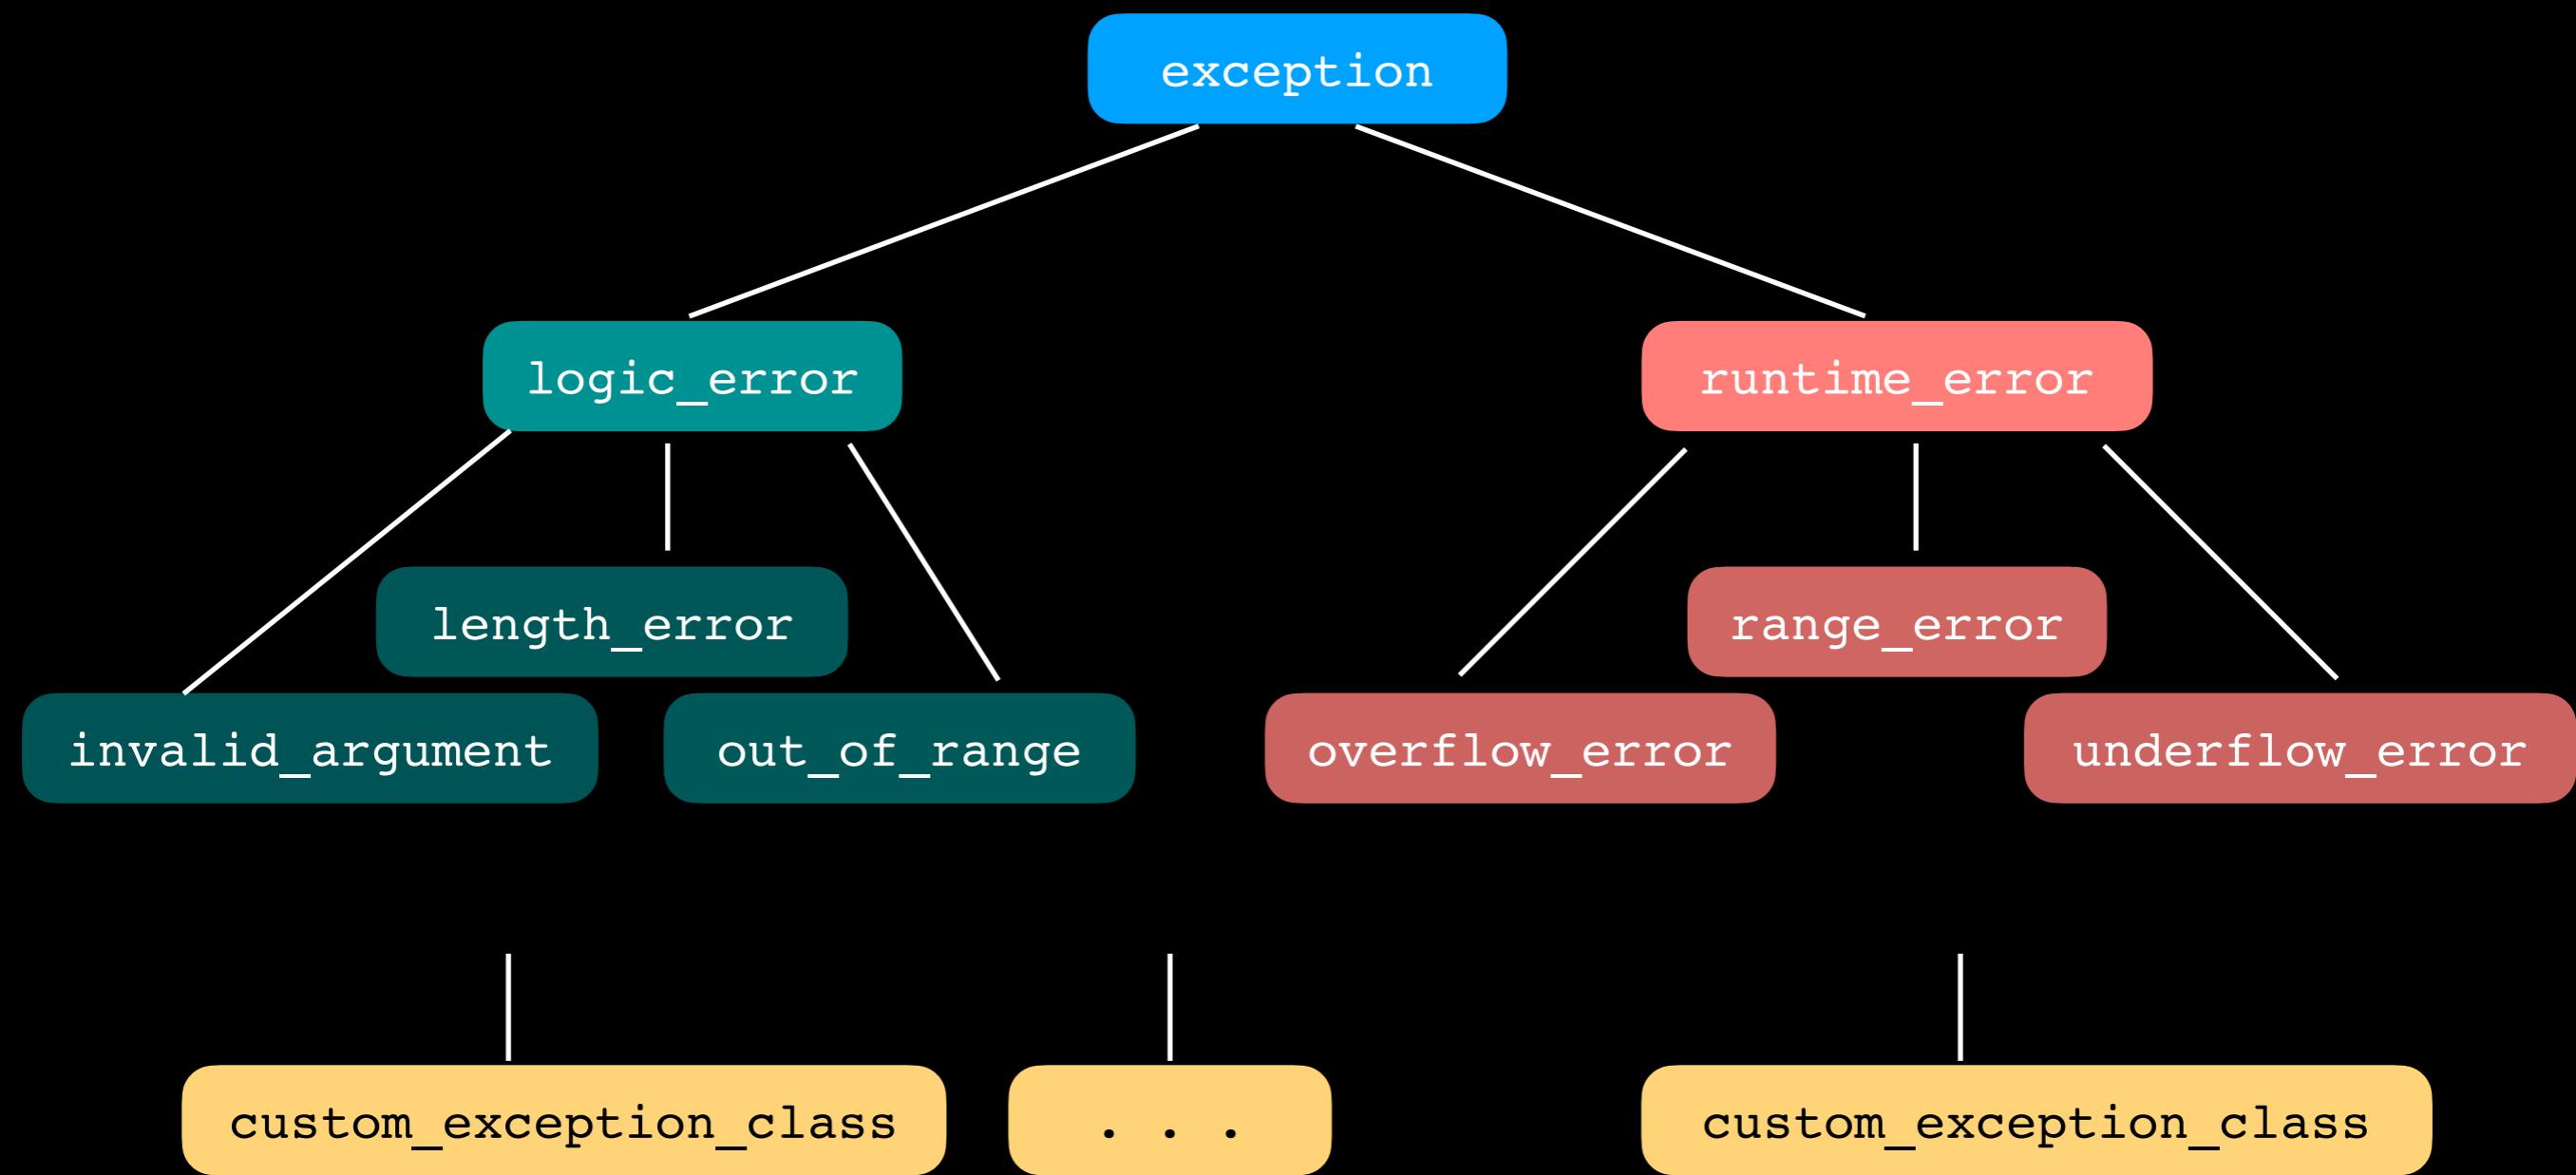

Type of Exception

**throw( *ExceptionClass*( *stringArgument* ) )**

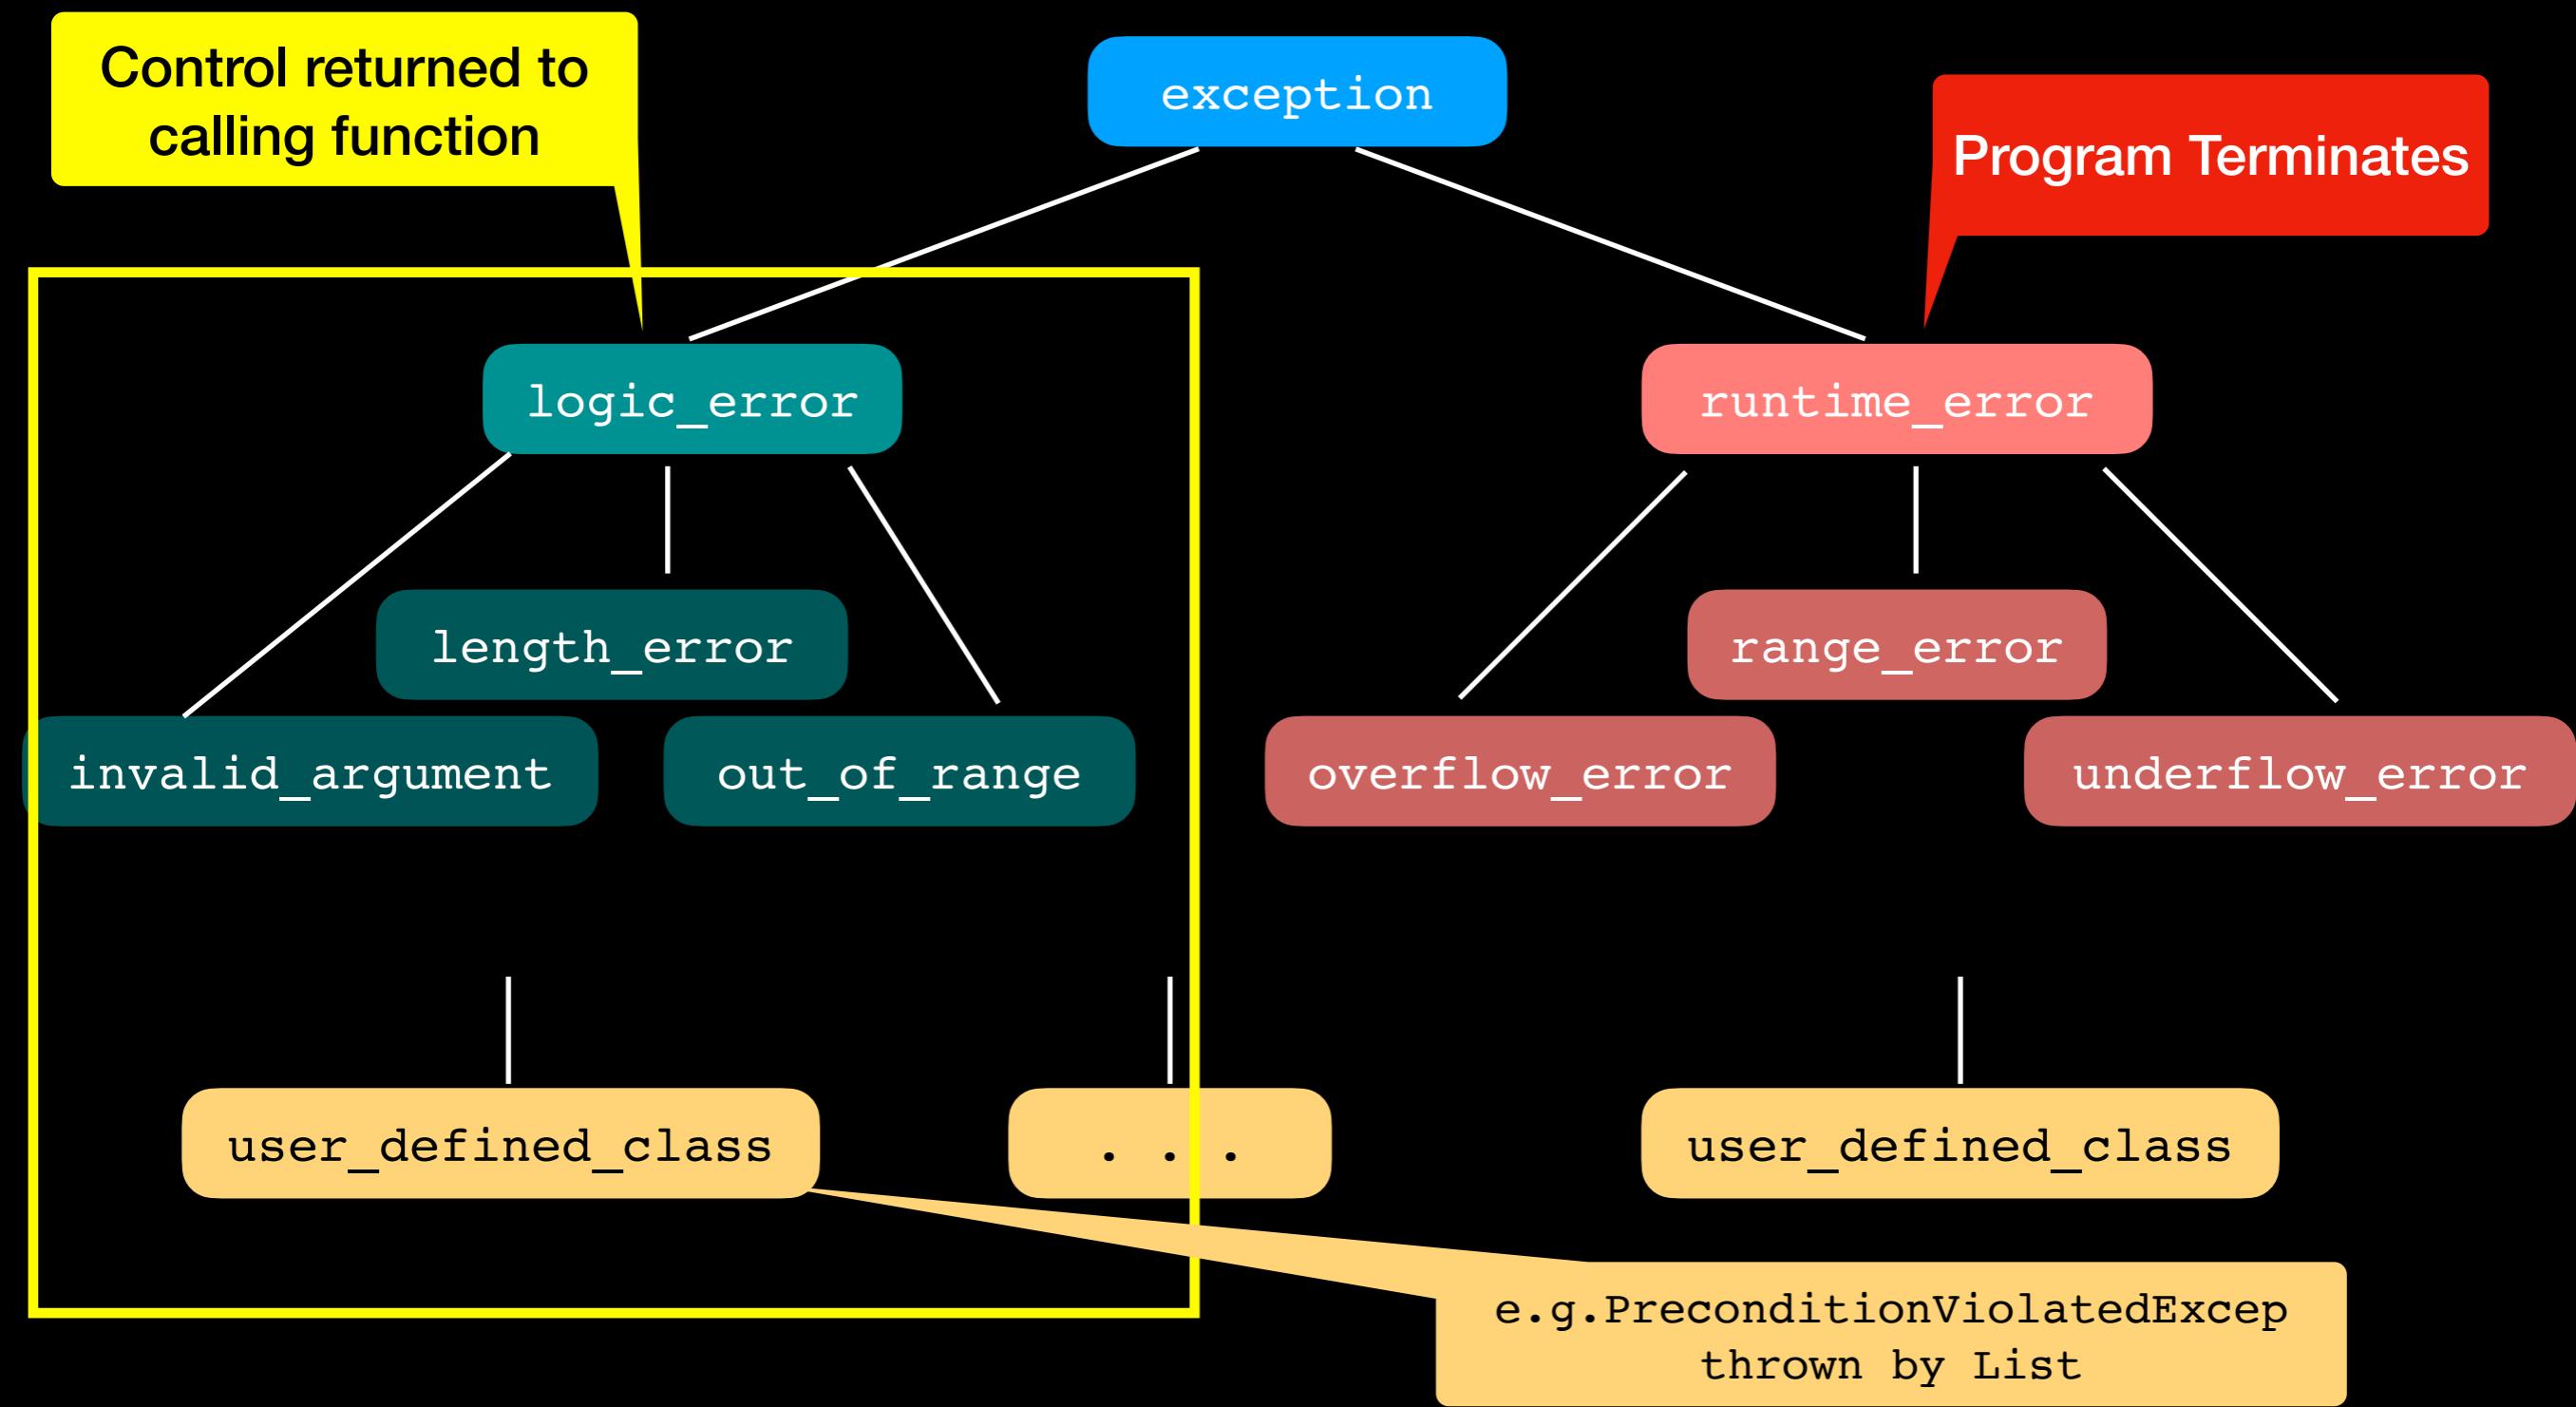

Message describing

```
template<typename ItemType>
ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw (std::out_of_range("getItem called with empty
                                list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

# C++ Exception Classes

# C++ Exception Classes

Exception Type	Header File
<code>exception</code>	<code>&lt;exception&gt;</code>
<code>bad_alloc</code>	<code>&lt;new&gt;</code>
<code>bad_cast</code>	<code>&lt;typeinfo&gt;</code>
<code>bad_exception</code>	<code>&lt;exception&gt;</code>
<code>bad_typeid</code>	<code>&lt;typeinfo&gt;</code>
<code>ios_base::failure</code>	<code>&lt;iostream&gt;</code>
<code>logic_error</code>	<code>&lt;stdexcept&gt;</code>
	<code>&lt;stdexcept&gt;</code>
<code>runtime_error</code>	<code>&lt;stdexcept&gt;</code>
	<code>&lt;stdexcept&gt;</code>
	<code>&lt;stdexcept&gt;</code>
	<code>&lt;stdexcept&gt;</code>

# Exception Handling

Can handle only exceptions of class `logic_error` and its derived classes

# Exception Handling Syntax

```
try
{
    //statement(s) that might throw exception
}
catch(ExceptionClass1 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
```

# Exception Handling Syntax

```
try
{
    //statement(s) that might throw exception
}
catch(ExceptionClass1 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
catch(ExceptionClass2 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass2
}
...
.
```

# Exception Handling Syntax

```
try
{
    //statement(s) that might throw exception
}
catch(const ExceptionClass1& identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
catch(const ExceptionClass2& identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass2
}
...
```

Arrange catch blocks in order of specificity,  
catching most specific first  
(i.e. lower in the Exception Class Hierarchy first)

Good practice to catch exceptions by const reference whenever possible  
(due to memory management, avoiding copying and slicing issues)

# Exception Handling Usage

You know getItem( ) may throw an exception so call it in a try block

```
try
{
    some_object = my_list.getItem(n);
}
catch(const std::out_of_range& problem)
{
    //do something else instead
    bool object_not_found = true;
}
```

```
template<typename ItemType> ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

```
try
{
    some_object = my_list.getItem(n);
}
catch(const std::out_of_range& problem)
{
    std::cerr << problem.what() << std::endl;
    //do something else instead
    bool object_not_found = true;
}
```

Returns string parameter to thrown exception

**Error Output Stream:**

getItem called with empty list or invalid position

# Uncaught Exceptions

```
template<typename ItemType> ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

out\_of\_range exception  
thrown here

```
ItemType someFunction(const List<ItemType>& some_list) {
    ItemType an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main() {
    List<string> my_list;
    try {
        std::string some_string = someFunction(my_list);
    }
    catch(const std::out_of_range& problem) {
        //code to handle exception here
    }
    //more code here
    return 0;
}
```

out\_of\_range exception  
handled here

# Uncaught Exceptions

```
template<typename ItemType> ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

out\_of\_range exception  
thrown here

```
ItemType someFunction(const List<ItemType>& some_list) {
    ItemType an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main() {
    List<string> my_list;
    std::string some_string = someFunction(my_list);
    //code here
    return 0;
}
```

out\_of\_range exception  
not handled here

Abnormal program  
termination

# Implications

There could be several  
... out of the scope of this course

We will discuss one:

What happens when program that dynamically allocated memory relinquishes control in the middle of execution because of an exception?

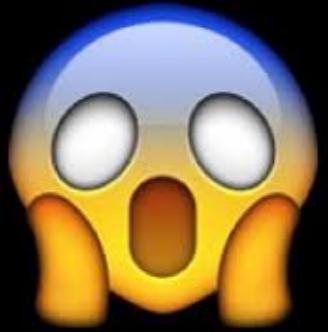

# Implications and Complications

There could be many  
... out of the scope of this course

We will discuss one:

What happens when program that dynamically allocated memory relinquishes control in the middle of execution because of an exception?

Dynamically allocated memory never released!!!

# Implications and Complications

Whenever using dynamic memory allocation and exception handling together must consider ways to prevent memory leaks

# Uncaught Exceptions

Memory Leak

```
template<typename ItemType> ItemType List<ItemType>::getItem(size_t position) const
{
    Node<ItemType>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

out\_of\_range exception  
thrown here

```
ItemType someFunction(const List<ItemType>& some_list) {
    //code here that dynamically allocates memory
    ItemType an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main() {
    List<string> my_list;
    try {
        std::string some_string = someFunction(my_list);
    }
    catch(const std::out_of_range& problem) {
        //code to handle exception here
    }
    //more code here
    return 0;
}
```

out\_of\_range exception  
handled here

**Possible solution coming soon**
